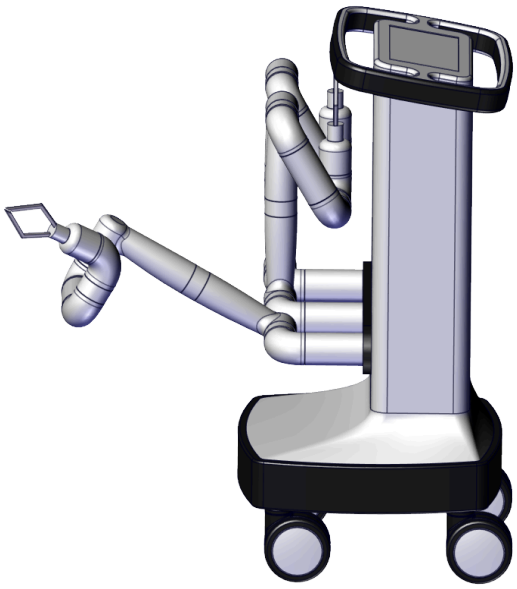
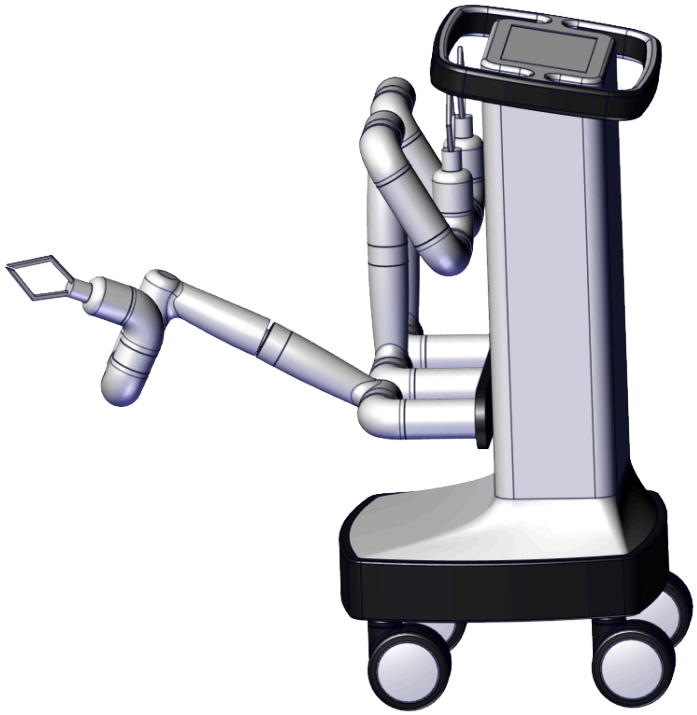
Annotation Design Tool (Optional)

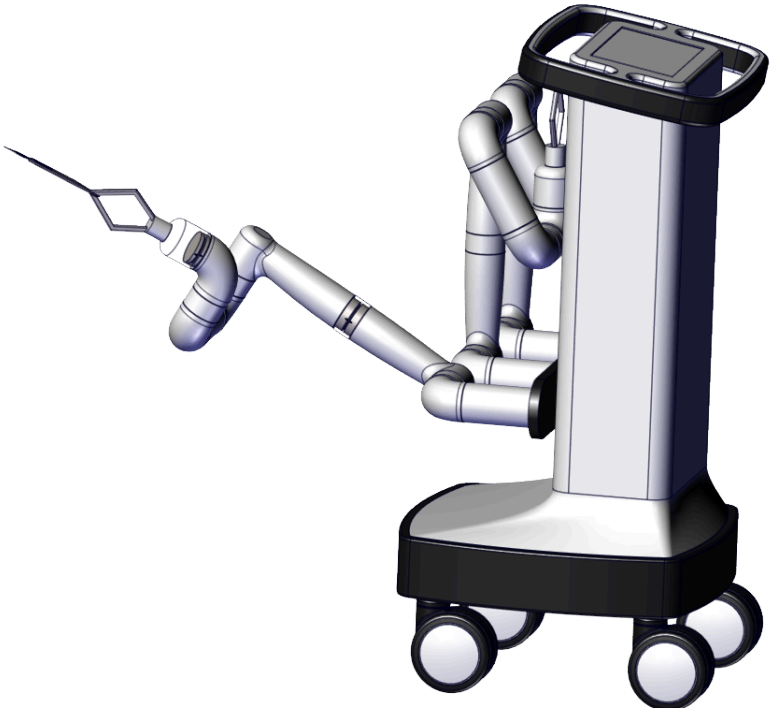
This document provides unannotated CAD images of the robotic arm components, allowing you to explore an optional hands-on exercise. You can use these images to practice annotating specific areas of the design, identifying potential issues, and proposing targeted design modifications. This exercise is entirely optional and serves as an additional tool to enhance your understanding of the robotic arm's components and their interplay within the system.

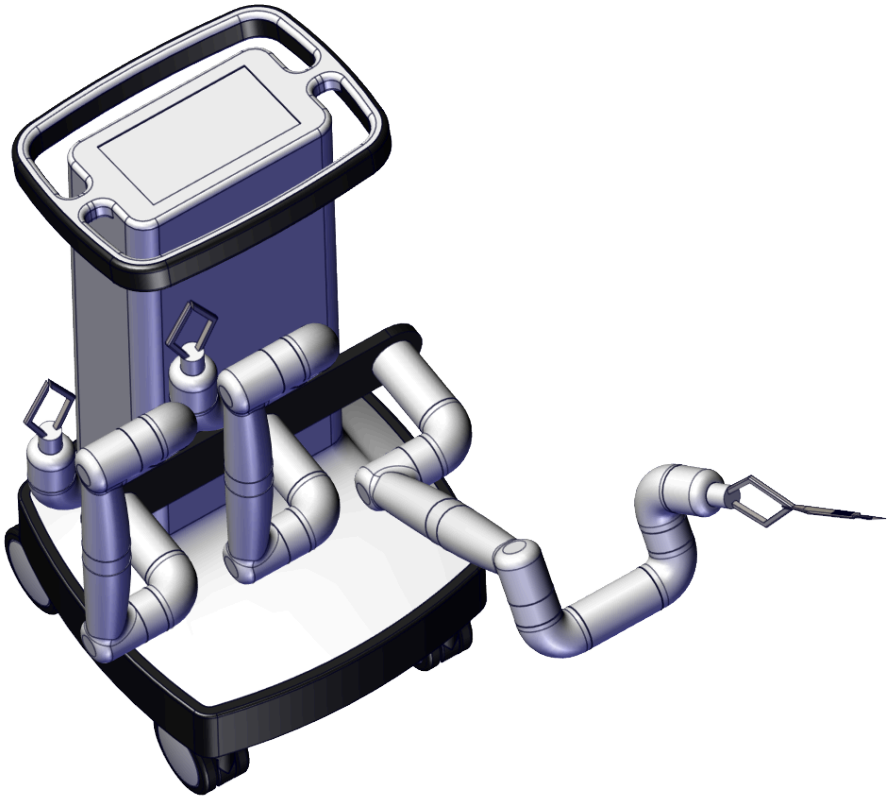
By creating your own annotations, you'll reinforce key concepts from Task 2 and develop a deeper appreciation for the relationships between components like actuators, sensors, and processing units. These annotations can also support your final design proposal by visually highlighting areas of improvement.

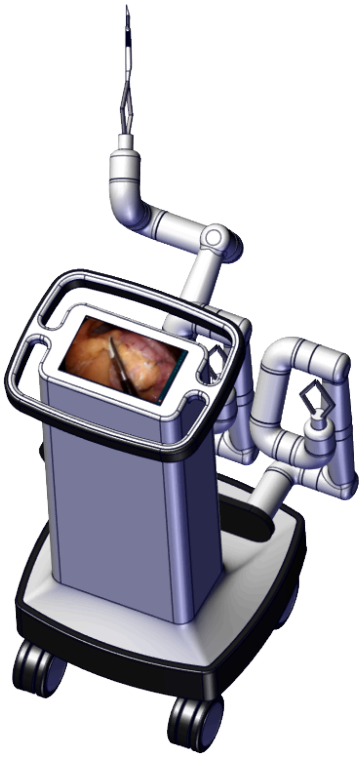
Feel free to download use digital annotation tools to mark your observations. While not required, this resource is a great opportunity to build confidence in identifying and communicating design optimizations.

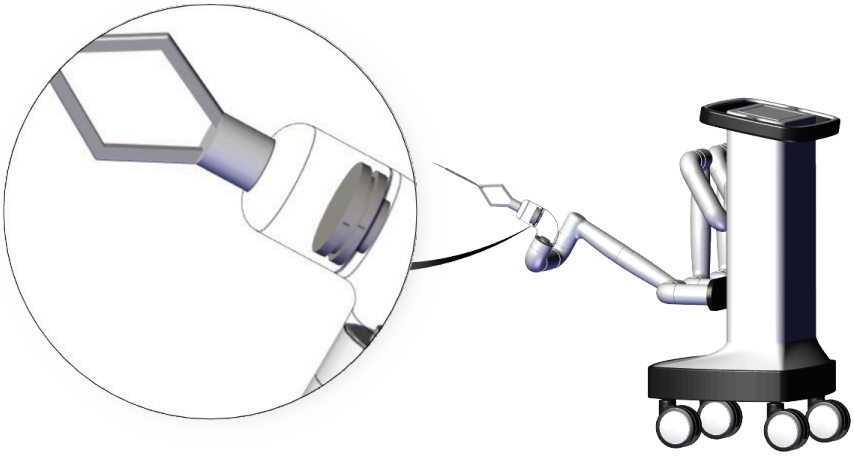


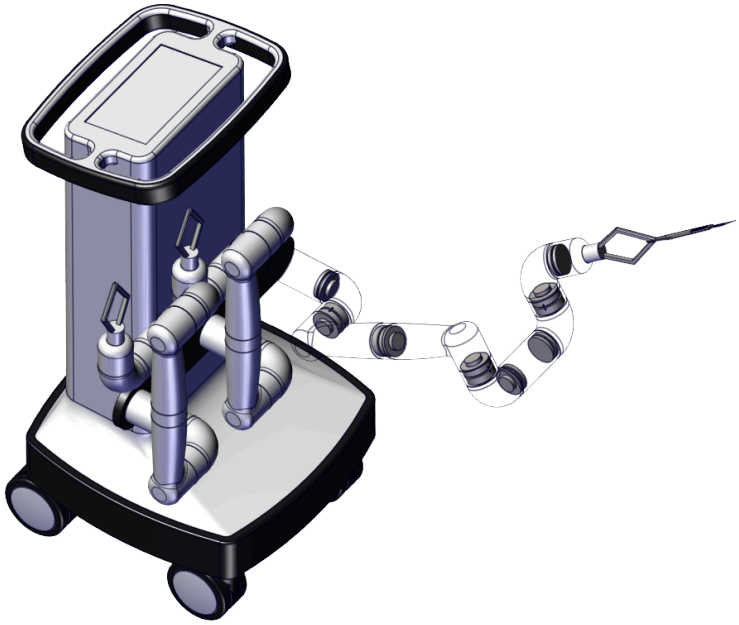


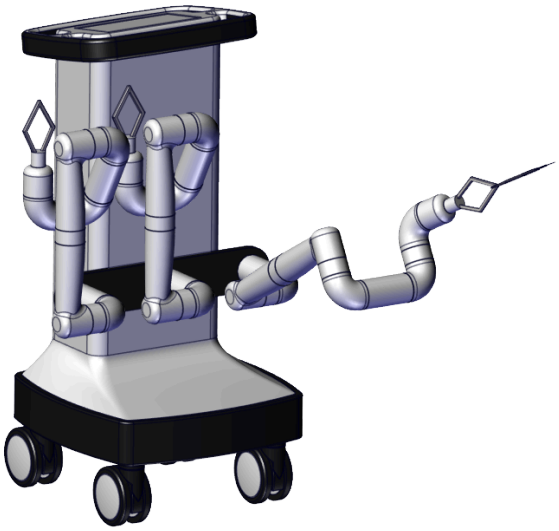












Disclaimer: The designs provided in this document are not representations of actual Johnson & Johnson robotic systems or their proprietary technology. These designs are conceptual and created specifically for the Johnson & Johnson Robotics Control Forage Program to facilitate educational and simulation-based learning. They are intended solely for use within this program and should not be used or interpreted as real-world Johnson & Johnson robotic designs.
